PRODUCT GUIDE

How OSCE Guide works

OSCE Guide helps doctors get ready for the practical exams of medicine, and helps the schools and employers who examine them. This guide describes the whole product in ordinary words: what each kind of user sees, what happens behind the screen, how the parts connect, and exactly what the product does when something goes wrong.

WHO USES IT	WHAT IT RUNS ON	REFUSALS DESCRIBED	CHECKED AGAINST
Doctors practising alone, schools, employers	One shared engine for every user	All 277 the product can give	Checked against commit 31a5e741, 8 Oct 2026

BEFORE YOU START

How to read this guide

Each chapter follows the same pattern. It opens with a short summary, shows a picture of what happens, walks through the steps in order, and ends with a box headed **What can go wrong, and what you would see**. Every line in those boxes is a refusal the product really gives today. They were taken from the product's own list of refusals, not written from memory, and a check runs on every change to the code to make sure none is missing and none is out of date.

Where a screen has its own wording for a refusal, we quote that wording. Where it does not, we quote the sentence the product sends with the refusal, which is what a person sees.

WORKS TODAY	Built, in use, and does what a user would expect.
WORKS, BUT ROUGH	People get through it, but it costs them time or a workaround.
NOT BUILT YET	People will ask for this and the answer today is no.

> **No invented people**

> This guide does not use made-up schools or names. Where an example helps, it describes a role, such as "a supervisor" or "a candidate", and uses timings and limits the product really applies.

CONTENTS

Nine chapters

CHAPTER 1
What OSCE Guide is
The exam, the people who use the product, and the rule that records are kept.

CHAPTER 2
One consultation, start to finish
A station, a session, a recording and its marking. Shared by everyone.

CHAPTER 3
Practising on your own
Nine stages, from finding us to closing an account.

CHAPTER 4
Running exams as a school
Six words, the people, and eight stages from set-up to results.

CHAPTER 5
Employers and partners
Recruitment outcomes, and what a partner can see.

CHAPTER 6
Our own team
What our staff console can do, and what it cannot.

CHAPTER 7
How the sides connect
The same recording marked two ways, and what crosses between sides.

CHAPTER 8
Reference
Roles, emails, every refusal in one place, and a glossary.

CHAPTER 9
What is still rough
The open problems we know about, in plain words.

CHAPTER 1

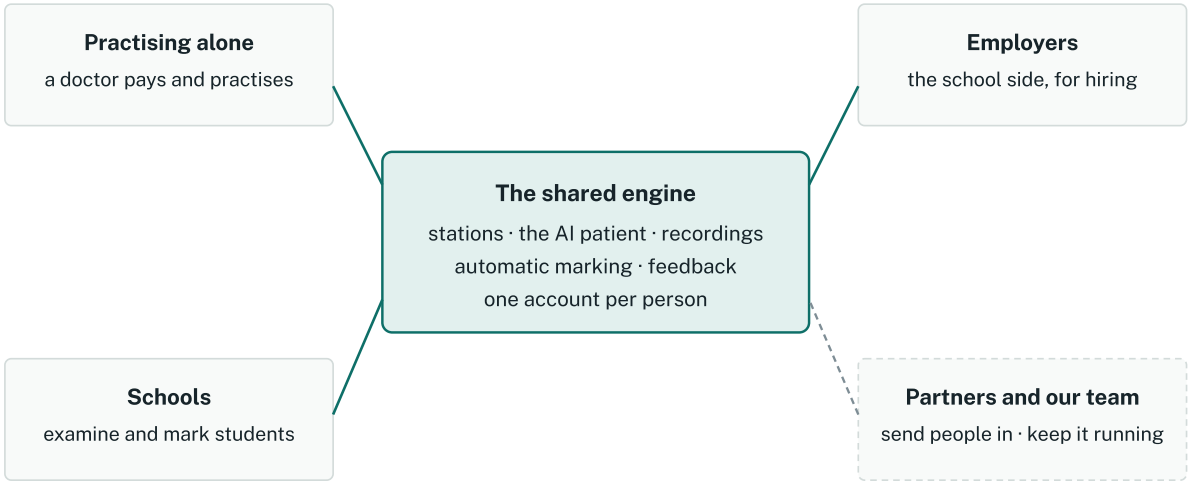

What OSCE Guide is

A place to practise and run the spoken, face-to-face exams of medicine, with an AI patient on the other side of the conversation.

Doctors are tested on more than what they know. In an **OSCE** (objective structured clinical examination) a candidate walks into a room, reads a short brief, and has a few minutes to talk to a patient: take a history, explain a diagnosis, agree a plan. An examiner watches and marks them against a fixed set of criteria. Then a bell rings and the candidate moves to the next room. A full exam is a circuit of these rooms, called stations.

OSCE Guide recreates that experience. The patient is played by an AI that speaks and listens, so a candidate can practise at any hour. Each conversation is recorded word for word and marked against the same kind of criteria a human examiner uses. Some exams covered today are the UK licensing exam for overseas doctors (PLAB Part 2) and the general practice licensing exam (the SCA).

Three groups of people use the product, and they use the same engine underneath.

One centre, three doors. Whoever comes in, the station, the AI patient, the recording and the marking are the same. What differs is who sets the practice up, who pays, and who decides what a result means.

THE THREE WAYS IN

WHO	WHY THEY COME	WHO PAYS	WHO DECIDES THE RESULT
A doctor practising alone	To get ready for an exam they will sit elsewhere.	They do, by card, after a free trial.	Nobody. They get feedback, not a pass or fail.
A school	To run practice circuits and real exams for its students, and mark them.	The school, under a contract with us.	The school's own senior staff, who sign off each result.
An employer	To assess doctors it may hire.	The employer,	The employer, who also

under a contract. records a hiring outcome.

Two more groups stand beside these. **Partners** are organisations that send people to us, such as a publisher or a course provider; they can see how many people they sent and what those people bought. **Our own team** sets organisations up, answers support questions and keeps the service healthy (chapter 6).

> **The rule behind most of the product: records are kept**
>
> A school may have to justify a pass or a fail to a student, an appeal panel or a regulator, months or years later. So the product switches things off rather than deleting them. A student who leaves has their access revoked. A member of staff who moves on loses their role. A school whose contract ends is suspended. A published station is archived, not deleted, and a corrected one becomes a new version. The one real deletion is personal: when a person closes their own account, they have 30 days to change their mind, and after that their personal details, and what they said in their recordings, are wiped.

CHAPTER 2

One consultation, start to finish

Everything else in this guide is built on one thing: a candidate talking to a patient at one station, and what happens to that conversation afterwards.

WHO
Every user: a doctor alone, a student in a school, a candidate for a job

HOW LONG
A few minutes of reading, then usually ten of talking

STATUS
WORKS TODAY

Inside a station

A **station** is one medical case, written down once and used for years. Different people are allowed to read different parts of it. The candidate sees only their brief. The AI patient is given its story, including details it should reveal only if asked the right question. The examiner's notes and the material for the after-session tutor are kept away from the candidate.

WHO READS WHICH PART OF A STATION

PART OF THE STATION	CANDIDATE	AI PATIENT	EXAMINER VIEW	DEBRIEF TUTOR

The brief: who the patient is and what the task is	●	○	○	○
The patient's story, worries and expectations	○	●	○	○
What the patient holds back unless asked	○	●	○	○
The examiner's notes on a good answer	○	○	●	○
Teaching notes for the debrief	○	○	○	●

Four readers, one document. Each section of a station is labelled with the one reader it is written for: the candidate, the patient, the examiner or the teaching faculty. The mark shows that reader. The product cuts the station into those pieces before anyone sees it, so a candidate can never read the answer by looking harder at the screen.

Stations are written on a **station template**, which sets the headings every station of that kind has. Stations change in versions. A draft can be edited freely. A published version is never changed in place; a correction becomes a new version, so every recording points at exactly the wording the candidate saw.

What happens in a session

1. Open
The candidate opens the station and reads the brief. Reading time is usually a few minutes.

›

2. The room opens
The product creates a private voice room and sends the AI patient into it.

›

3. The consultation
The candidate talks; the patient answers aloud. A clock counts down.

›

4. It ends
Time runs out, or the candidate finishes early. The conversation is saved word for word.

›

5. Marking
The transcript is marked against the station's marking scheme. Feedback appears on screen.

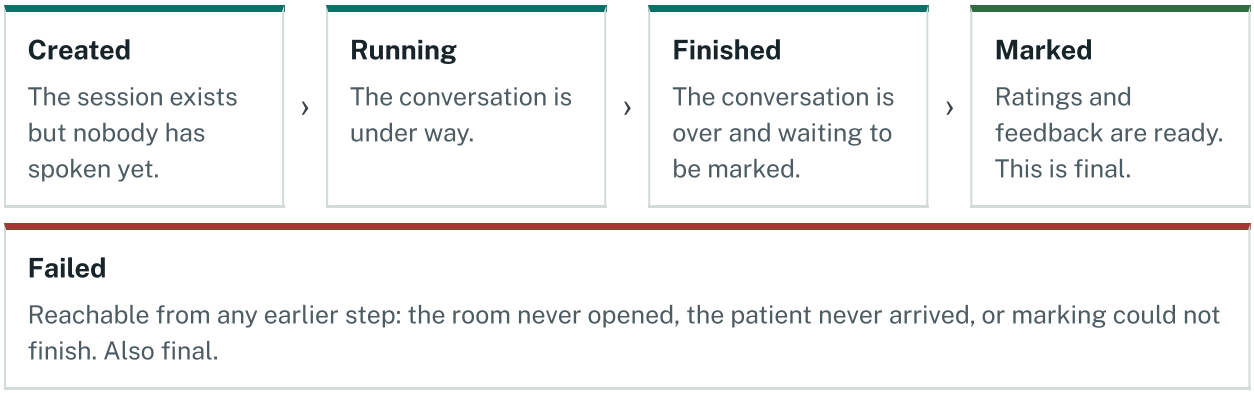

Five stages, the same for everyone. A practice session alone and a real exam in a school go through exactly these steps. In a school's exam the clock is run by the circuit rather than by the candidate (chapter 4).

1. **Open.** The product checks the person may use this station. For someone practising alone, that

means a live plan or a trial with room left. For a school's exam, it means being on that circuit. Exam-day sessions never check a plan.

2. **The room opens.** The product books a seat on the voice service and dispatches the AI patient with only the parts of the station it may read.
3. **The consultation.** Speech is turned into text as the candidate speaks, the patient's reply is generated, and the reply is spoken back. Everything said is written down.
4. **It ends.** The transcript is stored with the exact station wording frozen as it was at that moment. A session left running is closed automatically after three hours.
5. **Marking.** The automatic marker reads the transcript and rates each area of the marking scheme. The candidate sees ratings and written feedback, and can open the whole transcript.

The life of a recording

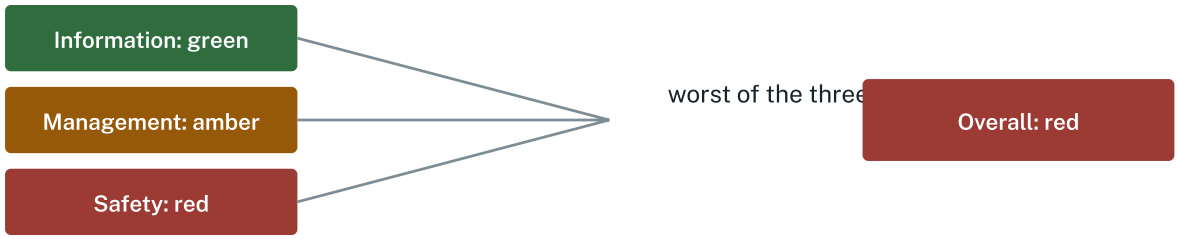

Five states, two of them final. A recording only moves forward. Once marked it is never re-marked in place; in a school, people add their own reviews on top of the automatic marking instead (chapter 4, stage 6).

How marking works

A **marking scheme** is the instrument a consultation is judged against. It has a scale (for example red, amber and green), the **areas** being judged (such as gathering information, management, and communication), and the exact wording that earns each rating in each area. Schemes are published in versions, like stations. An exam names one published version of a scheme, and that is what every consultation for that exam is marked against.

The automatic marker rates each area separately. The overall rating for the consultation is the **worst** of the area ratings: a green for communication does not rescue a red for safety. In a school, people can add their own ratings to each area, and how those combine is explained in chapter 4.

The worst area sets the overall rating. This is how the automatic marking reads a single consultation.

What can go wrong, and what you would see

- **The voice service cannot be reached.** The session does not open. You read: *"The voice service is not available right now."*
- **Rejoining a session that has already finished**, for example from an old tab. You read: *"That attempt has already finished."*
- **A step is asked for out of order**, such as finishing a session that never started. You read: *"The attempt is not in a state that allows this."*
- **Opening the feedback while the consultation is still to come.** The review tab says "not yet" rather than failing: *"This attempt has not finished, so there is nothing to review yet."*
- **The station has not been prepared for the session yet**, usually for a few seconds after opening it. You read: *"This attempt has no rendered definition yet."*
- **Following a link to a session that does not exist**, or belongs to another organisation. You read: *"No such attempt."*
- **Opening somebody else's session** without being an administrator allowed to see it. You read: *"That attempt belongs to someone else."*
- **Starting a station whose marking scheme is not published.** Refused at the start, so nobody sits a station that could never be marked. You read: *"This station cannot be marked yet: its rubric is not published."*
- **Something tries to mark against a draft scheme.** You read: *"That rubric version is not published."*
- **The automatic marker is switched off on this server.** Nothing can be marked until it is back. You read: *"Marking is not available on this server."*
- **Too many tabs are open on the same account**, each holding a live connection. You read: *"Too many live connections are open for this account. Close another tab and try again."*

CHAPTER 3

Practising on your own

A doctor preparing for an exam finds us, tries the product free, pays if it helps, and practises with the AI patient, with other doctors, and with the study library.

WHO
One doctor, with no school around them

PAYS
By card, per exam, for a fixed length of time

STATUS
WORKS TODAY

STAGE 1
Finding us
A link or a friend

STAGE 2
Signing up and the trial
Free, with three limits

STAGE 3
The first consultation
From the library

STAGE 4
Feedback and the debrief
Reading, then talking it through

STAGE 5
Paying
A plan per exam

Practice lists
Your own mock exams

STAGE 7
Practising with a person
Another doctor plays the patient

STAGE 8
Community, library, helper
Everything around the practice

STAGE 9
Your account
Sign-in, security, leaving

STAGE 1

Finding us

Most people arrive through a link from somebody else: a partner such as a publisher or course, or a friend who already uses the product.

---

1. **A partner's link.** When someone arrives through a partner's link, the product notes which partner sent them. If they sign up afterwards, the partner is credited with that person, once. There is no time limit: any visit through the link before signing up counts. A link naming a partner we do not know credits nobody.
2. **A friend's referral code.** Every user has a referral code. A friend who types it when paying gets the plan's referral price, which is 10% off the full price, and the person who shared the code is credited and told by email.
3. **The public website.** Anyone can read about the product and send us a message through the contact form, signed in or not.

> **What can go wrong, and what you would see**
>
> - **A referral code that does not exist**, or is the person's own. The payment screen says: *"That referral code is not valid. Check it, or clear it to pay the full price."*
> - **A good code on a plan with no referral price.** Refused rather than charging full price to

someone expecting a discount: *"That plan has no referral discount. Choose another plan, or clear the code."*

- **A contact message missing something it needs**, such as an email address to reply to. You read: *"That message cannot be sent as written."*

STAGE 2

Signing up and the free trial

A new account needs an email address, a password and a choice of exam. The exam decides which stations, study material and practice partners the person sees.

3	3	14
stations finished, of any kind, for this exam	different stations set up in practice lists	days from signing up, the last day included

The trial's three limits, counted separately. The trial ends at whichever limit is reached first. Stations are counted, not attempts, and a debrief does not count. Within the trial, each station in a practice list can be tried three times. A station that failed before it started does not use up the trial.

1. **Choose a password.** At least 12 characters, using at least two kinds of character out of lower case, upper case, numbers and symbols.
2. **Choose an exam.** This is set once. Changing it later is a support request, because it changes what the person has paid for.
3. **Start practising.** The trial begins at once. When it runs out, the library still shows, but starting a new station asks the person to subscribe or ask their organisation for access.

What can go wrong, and what you would see

- **Signing up with an address that already has an account.** The form marks the email field: *"That email address is already registered."*
- **A password that is too short or too simple.** The form marks the password field: *"Choose a stronger password."*
- **Trying to change exam from the account screen.** You read: *"Your exam is already set. Contact support to switch exams."*
- **The trial is used up, or a plan has ended.** One refusal, whatever the reason; the screen picks the wording. Trial over: *"Your free practice stations are used up. Ask your organisation for access, or subscribe, to keep practising."* Plan ended: *"Your access to this*

> *exam has ended. Ask your organisation to renew it, or subscribe, to keep practising."*

STAGE 3

The first consultation

The person picks a station from the library for their exam and goes through the five stages of chapter 2.

---

1. **Browse.** The library lists the published stations for the person's exam, searchable and in pages.
2. **Start.** The product checks the trial or plan, opens a room and sends the patient in.
3. **Resume.** If the person leaves mid-consultation and comes back, a session still running is offered back to them to resume, and an unstarted one is reused rather than duplicated.

> **What can go wrong, and what you would see**
>
> - **A station that has been withdrawn, or was never finished.** You read: *"This station is not available to practise right now. It may have been withdrawn or not finished yet."*
> - **A link to a station that does not exist** in the library or the person's organisation. You read: *"No such station."*
> - **Every try at a station in a practice list is used.** You read: *"You have used every attempt at this station."*

STAGE 4

Reading the feedback, then the debrief

The marking arrives on screen a short while after the consultation ends. The person can then talk it through with an AI tutor.

---

1. **Feedback.** A rating for each area of the marking scheme, the overall rating, written comments, and the full transcript.
2. **Debrief.** A spoken conversation with an AI tutor about a finished consultation. The tutor uses the station's teaching notes, asks how it felt, and works through what to do differently. It may play the patient once so the person can try a moment again.
3. **Memory.** After each debrief, a short summary is kept. The tutor uses these summaries to remember what the person has struggled with before, and the person can read them back in their debrief history.

> **What can go wrong, and what you would see**

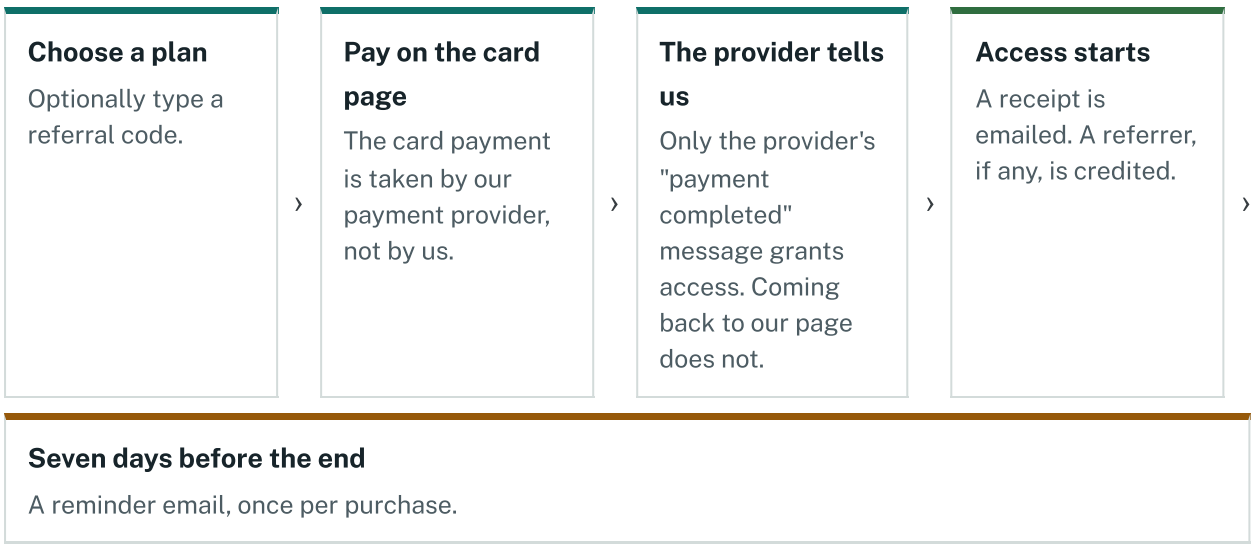

What can go wrong, and what you would see

- **Asking for a debrief on a station never attempted.** You read: *"A debrief needs a recorded consultation for this station. Attempt the station first."*
- **Opening a debrief summary that is not yours**, or no longer exists. Another person's gets the same answer: *"No such debrief."*
- **The tutor looks up a remembered note that is not there.** The tutor carries on without it: *"No such note."*

STAGE 5

Paying

Access is bought per exam, as a plan of a fixed length. Prices and lengths are set by us as data, not built into the product, so they can change without a release.

A purchase, end to end. If the provider sends the same message twice, the second is ignored, so nobody is granted access twice for one payment.

1. **Same plan again.** Buying a plan you already hold, running or bought to start, is refused. A **different** plan is allowed, and it starts where the current access ends, so time is never lost.
2. **Refunds.** If a payment is refunded, the access it bought is withdrawn, and any referral credit it earned is taken back.
3. **Disputes.** If a card holder disputes a payment with their bank, its access is withdrawn while the dispute runs. If we win, what the dispute took is given back.
4. **Receipts.** Each payment has a receipt the person can open again from their account.

What can go wrong, and what you would see

- **Buying the same plan while it is still running.** You read: *"You already have this plan. Choose a different plan to extend your access, or buy it again when it ends."*
- **A plan that is no longer on sale**, or not for your exam. You read: *"That plan is not available for your exam. Choose another plan."*
- **The card provider cannot start a payment.** Usually brief. You read: *"We could not start the checkout. Try again in a moment."*
- **A receipt link that is not yours**, or does not exist. Both get the same answer, so receipt numbers cannot be guessed: *"No such receipt."*

STAGE 6

Practice lists

A practice list is the person's own mock exam: a handful of stations they choose, to work through in order.

PRACTICE LIST OR CIRCUIT: TWO WAYS TO GROUP STATIONS

	A PRACTICE LIST	A CIRCUIT
Made by	The person practising	A school or employer
Who is in it	One person	A group, at the same time
The clock	Each station starts when the person is ready	Runs for everyone; a supervisor can pause it
Tries per station	Limited during the trial (three)	One slot per person per station, re-run only by a supervisor
Result	Feedback only	Feedback, human review and, in an exam, a decision

1. **Build.** Pick stations for your exam. Only published stations for the same exam can go in.
2. **Work through.** Each station runs as in chapter 2. The list remembers progress.
3. **Keep the record.** Once a station in a list has been tried, it cannot be taken out of the list and the list cannot be deleted, because the recordings point at it.
4. **When access ends.** The list locks, but its past sessions can still be reviewed.

What can go wrong, and what you would see

- **Opening a list after access has ended.** You read: *"This session is locked because your access has ended. You can still review it."*

- **Adding a station that is not available for this exam**, usually from a page left open too long. You read: *"One of these stations is not available for this exam."*
- **Removing a station that has already been tried.** You read: *"This set has a station that has already been attempted and cannot be removed."*
- **Deleting a list that has recordings in it.** You read: *"This set still has attempts recorded against it."*
- **A list that does not exist, or is somebody else's.** You read: *"No such practice set."*
- **A station that is not in this list.** You read: *"No such station in this set."*

STAGE 7

Practising with a real person

Two doctors preparing for the same exam meet in an online room. One plays the doctor, the other the patient, using a published station.

Join the queue

1. Press to find a partner now.
2. The longest-waiting person is matched first.
3. Both have 120 seconds to accept.
4. A wait of 10 minutes without a match ends the search; you can join again.

Offer a time

1. Post a slot of 5 to 180 minutes (30 by default).
2. Another doctor claims it.
3. A reminder email goes out an hour before.
4. The room opens 20 minutes before the start and closes an hour after.

Two ways to find a partner. Either way, both people must be preparing for the same exam, and the exam must have at least one published station to practise.

Who plays the doctor first

The product decides, in this order. Someone who has asked never to play the doctor plays the patient. If the two last played opposite roles, they swap. Someone who has never practised this way plays the doctor before someone who has. Otherwise, whoever has done fewer sessions plays the doctor. A person can never be paired with themselves.

1. **Recording.** A session can be recorded, transcribed and scored like a consultation with the AI patient. Its states are: not recording, recording, stopped, being transcribed, scored, failed, or erased.
2. **Feedback.** Once a session that began has finished, each person can leave feedback for the

other.

3. **Reports.** A person can report abuse or a partner who did not turn up. Both are emailed to our team.

What can go wrong, and what you would see

- **Joining the queue twice.** You keep your place: *"You're already in the practice queue."*
- **Leaving a queue you are no longer in.** You read: *"You are not in the queue."*
- **Your exam has no published station yet.** You read: *"There are no stations to practise for that exam yet."*
- **The other person declined, or the 120 seconds ran out.** You read: *"Your partner is no longer available for this session."*
- **Trying to join before both sides accepted.** You read: *"Both sides must accept this match before joining it."*
- **Acting on a session that has finished.** You read: *"That session has already finished."*
- **A session you were not part of.** You read: *"No such practice session."*
- **Leaving feedback before the session finished**, or on one that never began. You read: *"Feedback opens once a session you took part in has finished."*
- **Someone else claimed the slot a moment before you.** You read: *"This slot has already been claimed by someone else."*
- **The slot was withdrawn, expired or has started.** You read: *"That slot is no longer available."*
- **Claiming your own slot.** You read: *"You cannot claim your own slot."*
- **Withdrawing a slot someone else offered.** You read: *"Only the person who offered a slot can withdraw it."*
- **Joining more than 20 minutes before the start.** The session is fine; come back closer to the time: *"That session has not opened yet."*
- **Joining a cancelled session, or more than an hour after the start.** You read: *"That session can no longer be joined."*
- **A booked session that does not exist.** You read: *"No such session."*

STAGE 8

Community, study library and the helper

Around the practice itself there are places to ask questions, read, listen and get help.

---

1. **Community.** Questions and answers between doctors. A post's title can be up to 300 characters and its body up to 10,000. A post can be taken down by its author, by our moderators, or by an

administrator of the organisation it was addressed to. Posts can be addressed to everyone, an organisation, or a group within one.

2. **Study library.** Slide decks with narration, written summaries, articles and podcasts, searchable by exam.
3. **The helper.** A spoken assistant that answers questions about using the product and about the exam, and can look at the person's screen when asked. It cannot mark or change anything.
4. **Inbox.** Messages and announcements from our team, and replies to anything sent through the contact form while signed in.
5. **CV reading.** A person can upload their CV as a PDF so the product can tailor its suggestions.

> **What can go wrong, and what you would see**
>
> - **A post over 10,000 characters.** You read: *"That post is too long."*
> - **A post with nothing in it once spaces are removed.** You read: *"There is nothing to post."*
> - **A tag that is too long.** You read: *"That tag is too long."*
> - **A question with too many tags.** You read: *"That question has too many tags."*
> - **Removing someone else's post** without moderating anything it was addressed to. You read: *"You can only remove your own posts."*
> - **A post that does not exist, or that you may not see.** You read: *"No such post."*
> - **Posting to a group you are not in.** You read: *"You are not a member of that audience."*
> - **A post addressed to a mix of places that does not make sense together.** You read: *"That audience is not a coherent one."*
> - **Asking for another person's answer history.** Only your own can be listed: *"The only author filter is `me`."*
> - **Searching the library with nothing typed.** You read: *"Type something to search for."*
> - **A study item that does not exist.** You read: *"No such item."*
> - **The helper cannot answer right now.** You read: *"Athena is temporarily unavailable. Please try again."*
> - **Rejoining a helper conversation that has finished.** You read: *"That session has already finished."*
> - **Opening someone else's helper conversation.** You read: *"That assistant session belongs to somebody else."*
> - **A helper conversation that does not exist.** You read: *"No such assistant session."*
> - **A message that is not yours.** You read: *"No such message."*
> - **An announcement that has been withdrawn.** You read: *"No such announcement."*
> - **A CV that is not a readable PDF**, is too large, or has no text. You read: *"That file could not be read as a CV."*
> - **A CV that is not yours.** The same answer as one that does not exist: *"No such CV."*

STAGE 9

Your account: signing in, security and leaving

The same account is used on every side of the product. These rules apply to everyone.

---

1. **Signing in.** Email and password. After 10 tries in a minute on one account, or 300 from one address, the product asks the person to wait.
2. **Forgotten password.** A reset link by email, valid for 60 minutes and usable once. At most 5 requests in 5 minutes.
3. **Two-step sign-in.** An authenticator app gives a six-digit code at each sign-in. Ten one-use recovery codes are given for a lost phone, and can be replaced. An organisation can require it for its staff. Students and people practising alone are never forced to use it. People who sign in through their organisation's own system skip it, because that system checks the second step.
4. **Changing email.** A confirmation link goes to the new address, and a notice goes to the old one.
5. **Signing in through an organisation.** Some schools connect their own sign-in system. Their members then sign in there instead of with a password.
6. **Closing an account.** Sign-in stops at once and every device is signed out. Signing in again with the password within 30 days reopens the account, and an email confirms it. After 30 days the account is wiped: name, email, roster entries, the text of results, and what was said in recordings. An email confirms that too.

What can go wrong, and what you would see

- **A wrong password, or an address we do not know.** Both get the same answer, so nobody can test which addresses have accounts: *"Email or password is incorrect."*
- **Too many tries in a short time.** You read: *"Too many attempts. Wait a moment and try again."*
- **A member of an organisation that uses its own sign-in, trying a password.** You read: *"This account signs in through your organisation. Use your organisation's sign-in instead."*
- **An account that has been closed or switched off.** You read: *"This account is not active."*
- **Still signed in on a device after the account was wiped.** You read: *"Sign in again."*
- **A sign-in that has expired or was ended elsewhere.** You read: *"Sign in again."*
- **Opening a page that needs you to be signed in.** You are taken to sign in: *"Authentication required."*
- **Signing in with a temporary password a colleague passed on.** You are sent straight to choose your own: *"Set a new password before continuing."*
- **A reset link that is old or already used.** You read: *"That link is no longer valid. Ask for a new one and use the most recent email."* For an invitation link: *"That invitation has already been used or has expired."*
- **Changing a password on an account that never had one**, such as one that only signs in through its organisation. You read: *"This account has no password yet. Ask for a reset link*

through its organisation. You read: *"This account has no password yet. Ask for a reset link to set one."*

- **A wrong or reused six-digit code.** You read: *"That code is not valid."*
- **Taking too long between password and code.** You read: *"That took too long, so sign in again."*
- **Setting up two-step sign-in twice.** You read: *"An authenticator is already set up."*
- **Turning off two-step sign-in that was never on.** You read: *"This account has no authenticator set up."*
- **Turning off two-step sign-in your organisation requires.** You read: *"Two-factor sign-in is required for this account, so it cannot be turned off."*
- **An email-change link that is old, used, or for an address someone has taken since.** You read: *"That link has expired or has already been used."*
- **A profile photo that is not a small image.** You read: *"That file cannot be used as a profile photo."*

CHAPTER 4

Running exams as a school

A medical school, deanery or training scheme uses the same consultations to run practice sessions and real exams for a whole group, mark them with people as well as the AI, and tell each candidate their result.

WHO
An organisation with administrators, supervisors and trainees

PAYS
By contract with us, not by card

STATUS
WORKS TODAY

Six words, each inside the next

Almost everything on the school side is one of six things. Each lives inside the one before it, so once these six are clear the rest of the chapter follows.

SCHOOL
the organisation itself: its people, its web address, its contract

PROGRAMME
one exam the school runs, such as its final-year OSCE, with the marking scheme it uses

SITTING

one occasion: "the March mock" or "the summer finals", with its timings

CIRCUIT

one group going round the stations together, with a supervisor in charge

SLOT

one candidate at one station on that circuit

RECORDING

what happened in that slot: the conversation, the transcript and the marking, exactly as in chapter 2

The nesting. A school runs several programmes. Each programme has many sittings, each sitting one or more circuits, each circuit a slot for every candidate at every station, and each slot one recording.

Who does what

THE PEOPLE IN A SCHOOL, AND WHAT EACH MAY DO

ROLE	SET UP THE SCHOOL	WRITE STATIONS AND SCHEMES	SCHEDULE SITTINGS	RUN A CIRCUIT LIVE	REVIEW RECORDINGS	SENIOR REVIEW AND SIGN-OFF
Owner or administrator	Yes	Yes	Yes	Yes	Yes	Yes
Supervisor	No	No	No	Yes, when leading	The circuits they lead	No
Trainee or candidate	No	No	No	Takes part	Reads their own feedback	Reads a released result

When inviting someone, the screens offer two roles: supervisor and administrator. Trainees join through the roster instead (stage 3). A school must always keep at least one administrator.

STAGE 1

Setting up the school

A school cannot sign itself up. Our team creates it after a contract is agreed, then hands it over.

We create the school
Its name and a web address of its own, which can never change afterwards.

›

We seat the first administrator
An invitation email, valid for 7 days, with a reminder on day 5.

›

They choose a password
Or sign in through the school's own system, if it has one connected.

›

The checklist
Eight setup steps, shown in order until each is done.

From contract to first login. A school is always in one of three states: trial, active or suspended. There is no way to delete one; it is suspended instead, so its records survive.

The eight setup steps, in order

1. A marking scheme. 2. An exam. 3. A programme. 4. A station template. 5. Stations. 6. The team. 7. Trainees. 8. The first sitting. Each step needs the ones before it: a sitting needs a programme, a programme needs an exam, and an exam needs a marking scheme.

1. **Inviting the team.** An administrator invites supervisors and other administrators by email. If an invitation runs out, it can be resent. Someone who has already chosen a password gets a reset link instead.
2. **The school's own sign-in.** A school can connect its own sign-in system, so its people use their usual school login. It names the web address or email domain its people use, and that address can belong to only one school. It can then turn off passwords altogether, but only once nobody would be locked out.

3. **Switching between places.** A person who belongs to more than one organisation, or also practises alone, switches between them from their account menu. Each keeps its own records.

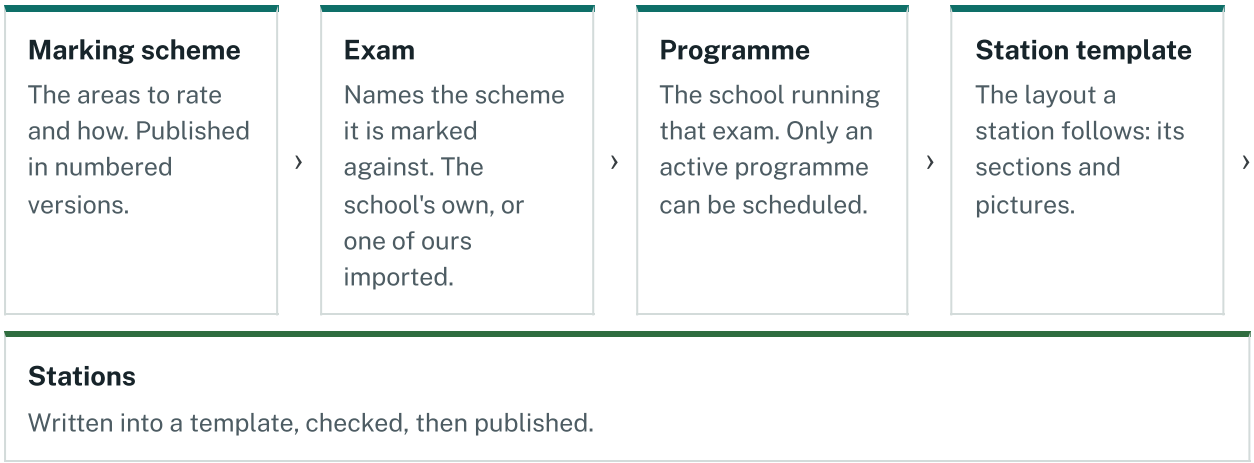

> **What can go wrong, and what you would see**
>
> - **Removing or demoting the only administrator.** You read: *"This is the organisation's last administrator. Make someone else an administrator first."*
> - **Inviting someone into a role they already hold.** You read: *"That person already holds this role."*
> - **Changing a member who has since been removed.** You read: *"No such membership."*
> - **Resending an invitation to someone who has already joined**, or who signs in through the school's system. You read: *"There is nothing to resend for that member."*
> - **Giving a temporary password to someone who has not yet accepted their invitation.** You read: *"This person has not set a password yet. Resend their invitation instead."*
> - **Giving a temporary password to someone who has chosen their own.** You read: *"This person has already chosen their own password. Send them a reset link instead."*
> - **Switching to an organisation you do not belong to.** You read: *"You are not a member of that organisation."*
> - **Acting in a school whose access has been suspended.** Members can sign in, but cannot act: *"This organisation's access has been suspended."*
> - **A web address for a school that does not exist.** You read: *"No such organisation."*
> - **Claiming a web address or email domain another organisation already uses.** You read: *"Another organisation already claims that host or email domain."*
> - **An address or domain that is not one.** You read: *"That is not a usable hostname or email domain."*
> - **Turning off passwords while some members only have a password.** The screen lists how many would be affected: *"Some members sign in with a password and would be locked out."*
> - **Settings that would leave nobody a way in**, such as turning off passwords while the school's own sign-in is off. You read: *"That combination of settings would leave nobody a way in."*
> - **Naming a sign-in provider we do not know.** You read: *"That is not an identity provider this platform knows."*
> - **A sign-in connection missing its address or certificate.** You read: *"That SAML connection is not usable."*
> - **A sign-in connection that has been switched off or removed.** You read: *"No such SAML connection."*
> - **Signing in through a school that has no sign-in system connected**, or has switched it off. You read: *"That organisation does not sign in through an identity provider."*
> - **The school's sign-in system did not vouch for you**, usually an interrupted login. You read: *"That sign-in could not be verified. Try again."*

- **A school whose sign-in provider we know of but have not built yet.** You read: *"That organisation's sign-in provider is not enabled here."*
- **The service that links to school sign-in systems cannot be reached.** Nobody is let in by mistake: *"Sign-in through an identity provider is not available here."*

STAGE 2

Exams, marking schemes and stations

Before anyone can be examined, the school needs an exam to run, a scheme to mark it against, and stations to put in it. It can write its own, or bring in ours.

What a sitting stands on. Every piece has drafts and published versions. A published version is never changed in place: a change is a new draft, published as the next version, so a recording always points at exactly what the candidate was given.

1. **Writing a station.** Write by hand, start from an uploaded document, or ask the AI to draft one from a brief. A station can have pictures, such as an X-ray or a rash, in the places its template allows.
2. **Fact check.** Before publishing, the AI can check the station's medical facts and mark anything doubtful for a person to look at.
3. **Publishing.** A draft with nothing in it cannot go live. Publishing the next version leaves earlier recordings pointing at the version they used.
4. **Retiring.** A published version is archived rather than deleted, and only a draft can be deleted. An exam that has anything recorded against it is retired, never deleted.
5. **Reports.** Anyone using a station can report a problem with it. The report goes to its authors.

What can go wrong, and what you would see

- **Two exams with the same short code.** You read: *"An exam with that code already exists."*
- **A short code with characters a web address cannot carry.** You read: *"That is not a usable exam code."*
- **Publishing an exam with no marking scheme**, or one that is retired. You read: *"That exam cannot be published as it stands."*
- **Deleting an exam that has stations, sittings or recordings.** You read: *"This exam has stations, sittings or attempts recorded against it. Retire it instead of deleting it."*
- **Bringing in one of our exams that the school already runs.** You read: *"That exam is already in this organisation."*
- **Exam settings naming an AI writing setup that does not exist.** You read: *"Those exam settings name a prompt that does not exist."*
- **An exam that is missing, unpublished, retired, or another school's.** You read: *"No such exam."*
- **Adding a programme for an exam the school already runs.** You read: *"A programme with that name already exists."*
- **Scheduling against a programme that has stopped**, or whose exam is retired. You read: *"That programme is not active, so nothing can be scheduled against it."*
- **A programme that is not this school's.** You read: *"No such programme."*
- **A marking scheme whose areas or timings cannot work.** You read: *"That rubric could not be marked against."*
- **A station with no marking scheme.** You read: *"This station has no marking scheme, so it cannot be marked."*
- **A marking scheme missing the version a station points at.** You read: *"The marking scheme for this station is missing a version. Ask the station's owner to republish it."*
- **Starting a second draft of a station that already has one.** You read: *"The station already has a draft. Publish or delete it first."*
- **Changing a published version in place.** You read: *"Published content cannot be edited; create a new version."*
- **Publishing a version that is already live.** You read: *"That version is already published."*
- **Publishing a draft with nothing written in it.** You read: *"This station has no content yet. Write it before publishing."*
- **Building a station on a template that is still a draft.** You read: *"A station can only be built on a published template version."*
- **Deleting a version that has been published.** You read: *"Only a draft can be deleted."*
- **Archiving a draft.** A draft is deleted instead: *"Only a published version can be archived."*
- **Saving while the AI is still writing this draft.** You read: *"The agent is working on this version; stop it or wait for it to finish."*
- **Asking for a fact check that is already running.** You read: *"This version's facts are already being checked."*
- **Uploading a document that cannot become a station**: the wrong kind, too large, or empty

Uploading a document that cannot become a station. the wrong kind, too large, or empty. You read: *"That file cannot be imported as a station."*

- **Drafting from an upload that is still being read**, or already being drafted. You read: *"That import is not ready for a station to be drafted."*
- **An upload that does not exist.** You read: *"No such station import."*
- **A picture that is not a real image, or is too large.** You read: *"That file cannot be used as a station image."*
- **Adding a picture where the template does not take one.** You read: *"That block does not take images."*
- **Removing a picture that is not on this station.** You read: *"That image is not on this station."*
- **Picture storage is not set up** on this copy of the product. You read: *"Image storage is not configured."*
- **A version of a station that does not exist.** You read: *"No such version."*
- **A station template that is not this school's.** You read: *"No such station template."*
- **A template version that does not exist.** You read: *"No such station template version."*
- **Asking the AI to draft with a writing setup that does not exist.** You read: *"No such generation profile."*
- **A report on a station that has since been dealt with or removed.** You read: *"No such report on a station."*

STAGE 3

Candidates arrive: the roster

The roster is the school's list of its trainees. A circuit can only examine people on it.

---

1. **Adding people.** One at a time, or from a spreadsheet. A spreadsheet can hold up to 500 people per upload; the screen sends larger lists in batches. Someone already on the list is skipped, not added twice. Each new trainee gets an invitation email.
2. **Cohorts and groups.** A cohort is a year group, and a trainee is in at most one. Groups are any other way of sorting people, such as by hospital site, and a trainee can be in several.
3. **Automatic lists.** A school with its own sign-in system can keep the roster in step with it automatically. Changes flow from the school's own records, so nobody re-types them.
4. **Practice access.** A school can also give trainees access to practise alone (chapter 3) for an exam, until a date it chooses, instead of each trainee paying.
5. **Leavers.** Removing someone's access is how a person leaves. Their records stay. A trainee who has a decision recorded cannot be deleted, only have their access removed.

What can go wrong, and what you would see

- **Adding someone already on the list.** You read: *"That person is already on your trainee list."*
- **More than 500 people in one upload.** The screen normally splits the list itself: *"An import takes at most 500 trainees at a time."*
- **A trainee who has been removed.** You read: *"That trainee is no longer on your list."*
- **Putting someone whose access was removed into a sitting.** You read: *"That person's access has been removed. Restore them before adding them to a sitting."*
- **Deleting a trainee who has a decision recorded.** You read: *"This trainee has a decision recorded and cannot be deleted. Revoke access instead."*
- **Examining someone who is not on the school's list.** You read: *"That person is not on your trainee list. Add them first."*
- **Two year groups with the same name.** You read: *"A cohort with that name already exists."*
- **Deleting a year group that still has trainees.** You read: *"That cohort still has trainees in it."*
- **A year group that has been deleted.** You read: *"That cohort no longer exists."*
- **Two groups with the same name.** You read: *"A group with that name already exists."*
- **Deleting a group that still has members.** You read: *"That group still has members."*
- **A group that has been deleted.** You read: *"That group no longer exists."*
- **Giving practice access to something that is not an email address.** A spreadsheet reports it per row: *"That is not a valid email address."*
- **Giving practice access to someone who already has it** from this school for this exam. You read: *"That person already has practice access to this exam."*
- **Changing practice access that has ended or was never given.** You read: *"No such entitlement in this organisation."*

STAGE 4

Scheduling a sitting

A sitting is one occasion, such as "the March mock". It belongs to one programme and is either a training session or a real exam.

TRAINING SESSION OR REAL EXAM

	TRAINING SESSION	REAL EXAM
Who is on a circuit	As many trainees as there are stations, rotating together	One candidate, going round up to 12 stations
Breaks	None	Yes, between stations

After marking	Stops at feedback and review	Goes on to a decision and a result
Hiring outcome	Never	Optional, for employers (chapter 5)

1–30	1–180	1–60
minutes of reading time before each station, 3 by default	minutes in the consultation, 10 by default	minutes of break between stations in an exam, 5 by default

Timings a sitting sets. A value outside its range is brought back to the nearest end of it.

1. **Build circuits.** Choose stations, candidates and a supervisor to lead. The lead must be an administrator or supervisor of the school.
2. **When things lock.** A circuit's stations and people can no longer change once it has ended, once a station on it is in progress, or once feedback has been recorded on it. A sitting's content locks once any of its circuits has started, so everyone sitting it is examined on the same thing.

What can go wrong, and what you would see

- **A sitting with no programme.** You read: *"Choose a programme for this sitting first."*
- **Scheduling an exam whose marking scheme has no published version yet.** You read: *"That programme's exam is not ready to mark against yet."*
- **A circuit the rules do not allow**, such as more than 12 stations in an exam, or a training circuit with more trainees than stations. You read: *"This circuit cannot be built as set up. Check the stations, candidates and timings."*
- **Naming a lead who is not a supervisor or administrator.** You read: *"A circuit's lead must be an administrator or supervisor of this organisation."*
- **Adding someone twice to the same circuit.** You read: *"That person is already on this circuit."*
- **Changing a circuit that has started or has feedback.** You read: *"This circuit has started or has feedback recorded, so its stations can no longer be changed. Reload to see where it is now."*
- **Changing or cancelling a sitting once a circuit has started.** You read: *"A circuit on this sitting has started, so it cannot be cancelled. End its circuits instead."*
- **An action meant for the other kind of circuit**, such as a break in a training session. You read: *"That action does not apply to this kind of circuit."*
- **A sitting that has been deleted.** You read: *"This sitting no longer exists. It may have been deleted."*
- **A circuit that has been deleted.** You read: *"This circuit no longer exists. It may have been deleted."*

- **Two people editing the same thing at once.** The second save is refused rather than overwriting the first: *"This was changed by someone else since you opened it. Reload and try again."*

STAGE 5

Exam day

The supervisor presses one button to start the circuit. From then on the product runs the clock, opens each room, sends each patient in and moves everyone on.

Supervisor

1. Starts the circuit.
2. Watches every room on one screen.
3. Can listen in to any room.
4. Steps in when needed.

Candidate

1. Joins from their own screen.
2. Reads the instructions.
3. Holds the consultation.
4. Moves on when the clock says.

AI patient

1. Arrives when the station opens.
2. Plays the case as written.
3. Leaves when time is up.

What is saved

1. The recording and transcript.
2. The time each step happened.
3. Every step a supervisor took, with who and why.

Exam day in four lanes. Exam day never checks a plan or a trial: a candidate a school examines is never turned away for not having paid.

What a supervisor can do while it runs

Pause and resume the clock, give extra time, restart the clock on a station, send the patient in again, let a candidate redo a station, jump to a station, move everyone on now, or let the circuit move on by itself. Every one of these is saved with the name of the person who did it and the reason they gave.

1. **The minute check.** Every minute the product checks every live circuit. A patient who has gone quiet for 60 seconds is sent in again.
2. **Forgotten circuits.** A circuit left untouched for 12 hours is closed by itself, unless it is paused

2. **Forgotten circuits.** A circuit left untouched for 12 hours is closed by itself, unless it is paused on purpose.

What can go wrong, and what you would see

- **Acting on a circuit that has not been started.** You read: *"The circuit has not been started yet."*
- **Joining a circuit that is not running**, because it has not begun or is over. You read: *"The circuit is not running, so nothing can be sat on it now."*
- **Moving on while the clock is paused.** You read: *"The circuit is paused. Resume it first."*
- **Resuming a clock that is running.** You read: *"The circuit is not paused."*
- **Acting on a circuit that has finished.** You read: *"The circuit has already ended."*
- **Stepping into a station during a break**, when none is running. You read: *"No station is being sat on this circuit right now."*
- **Jumping to a station this circuit does not have.** You read: *"That station is not on this circuit."*
- **A candidate's place on the circuit that no longer exists.** You read: *"That place on the circuit no longer exists. Reload the page."*
- **Doing something your role does not allow**, such as a candidate opening a supervisor's screen. You read: *"You do not have access to this resource."*

STAGE 6

Marking

Every recording is marked by the AI first, exactly as in chapter 2. In a school, people then review it, and their ratings are what count.

THREE REVIEWERS, THREE AREAS: HOW RATINGS COMBINE

	REVIEWER A	REVIEWER B	REVIEWER C	AREA RESULT
History taking	Good	Good	Fair	**Good**, the most common
Explanation	Good	Fair	Poor	**Poor**, a tie goes to the worse
Safety	Fair	Fair	Good	**Fair**, the most common
Station overall				**Poor**, the worst area

Within an area, the most common rating wins, and a tie goes to the worse one. Across

Within an area, the most common rating wins, and a tie goes to the worse one. Across **areas, the worst area sets the station.** One weak area cannot be hidden by strong ones.

1. **Who reviews.** The supervisor who led the circuit, or an administrator. Each person writes one review per candidate per station.
2. **Drafts.** A review stays a draft until every area is rated. Its author can withdraw a draft; a completed review is edited instead, never withdrawn.
3. **Senior review.** An administrator can add a senior review on top, with a reason of up to 4,000 characters. If someone else saved it first, the screen asks you to reload rather than overwrite them.
4. **Finalising.** Once every review on a circuit is done, the circuit's review is finalised. After a decision is signed off, its reviews are fixed.

What can go wrong, and what you would see

- **Reviewing a circuit you did not lead**, without being an administrator. You read: *"Only the supervisor named on this circuit, or an administrator, can review it."*
- **Completing a review with an area unrated.** You read: *"Rate every required area before completing the review."*
- **A rating the scheme does not use.** You read: *"One of the ratings is not one this station accepts. Pick again from the list."*
- **Saving a review as something other than a draft or completed.** You read: *"A review can only be saved as a draft or completed."*
- **Someone else changed the review while you had it open.** You read: *"Someone else changed this review while you had it open. Reload the page and make your changes again, so theirs are not lost."*
- **Withdrawing a completed review.** You read: *"Only a draft review can be withdrawn. A completed review is edited instead."*
- **Changing a review after the result was signed off.** You read: *"This candidate's result has been signed off or released, so its reviews can no longer be changed."*
- **A station nobody took, or with no areas to rate.** You read: *"Nobody took this station, so there is nothing to review."*
- **Finalising a circuit's review twice.** You read: *"This circuit's review has already been finalised."*
- **A review that has been withdrawn.** You read: *"That review no longer exists. Reload the page."*

STAGE 7

Deciding and telling the candidate

In a real exam, a senior person records each candidate's outcome, signs it off, and releases it. The candidate sees nothing until it is released.

Draft
An outcome and a written reason. Saved in versions.

›

Signed off
Needs every review complete, an outcome and a reason.

›

The evidence check
If any mark moved since sign-off, release is refused until it is signed off again.

›

Released
The candidate is emailed and can read it.

The life of a decision. Outcomes are pass, fail, inconclusive and withheld. Inconclusive and withheld are never released to the candidate.

WHICH HIRING OUTCOMES GO WITH WHICH EXAM OUTCOME

EXAM OUTCOME	HIRING OUTCOMES ALLOWED
Pass	Hired, reserve, not hired, withdrawn or pending
Fail	Not hired or withdrawn
Inconclusive or withheld	Pending or withdrawn

Hiring outcomes are for employers and are optional (chapter 5). A school simply leaves them out.

What can go wrong, and what you would see

- **Signing off while a review is still a draft.** You read: *"A review of this candidate's stations is still a draft. Complete it, or ask its author to withdraw it, then sign off."*
- **Signing off with no outcome or no reason.** You read: *"This decision cannot be signed off yet. Choose an outcome and write the reason first."*
- **A mark changed after sign-off.** You read: *"The marking changed after this was signed off. Review it and sign it off again before releasing."*
- **Releasing an inconclusive or withheld outcome.** You read: *"A withheld or inconclusive outcome cannot be released."*
- **A step out of order**, such as releasing before sign-off. You read: *"This decision is not in the right stage for that. It must be signed off, and not yet released."*
- **Someone else changed the decision while you had it open.** You read: *"Somebody else changed this decision. Reload it and check it before saving again."*
- **An exam outcome and hiring outcome that cannot both be true.** You read: *"That outcome and the hiring outcome do not go together. Change one of them."*

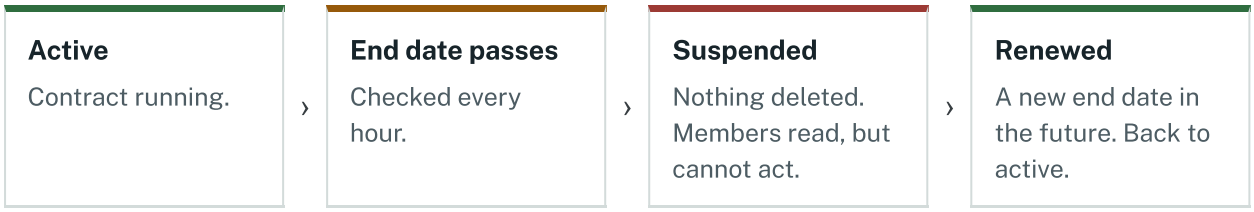

- **A hiring outcome on a training session.** You read: *"A hiring outcome can only be recorded on an exam sitting."*
- **A decision on a training session**, which stops at marking. You read: *"Decisions are recorded for exam-mode sittings only."*
- **A decision for someone who sat no station.** You read: *"This candidate did not sit any station on this sitting."*
- **Opening a decision nobody has recorded yet.** You read: *"No decision has been recorded for this candidate yet."*
- **A candidate opening a result before release.** You read: *"This result has not been released to the candidate yet."*

STAGE 8

Term after term

After the exam, the school reads its results, moves people on, and renews its contract.

1. **Reports.** A summary per exam sitting shows how the group did, station by station and area by area. Training sessions get feedback, not a group summary.
2. **Leavers and new years.** New trainees join the roster; leavers have their access removed. Their past records stay.
3. **Contract end.** When the contract's end date passes, an hourly check suspends the school. Its members can no longer act in it. Our team renews it with a new end date, which must be in the future, and everything is as it was.

Contract end and renewal.

What can go wrong, and what you would see

- **Asking for a group summary of a training session.** You read: *"A cohort summary is only produced for an exam sitting."*
- **Renewing with an end date already passed.** It would lapse again within the hour: *"A renewal must end in the future."*
- **A contract that ends before it starts.** You read: *"The end date is before the start date."*

CHAPTER 5

Employers and partners

Employers use exactly the school side to assess job applicants. Partners, such as publishers and courses, send people to us and see how many came.

WHO
Hospitals, practices and recruiters; publishers and courses

PAYS
Employers by contract; partners are paid by us

STATUS
WORKS TODAY

Employers: the school side, with one extra field

An employer is set up as an organisation, like a school, and runs real exams exactly as chapter 4 describes. The only difference is a second outcome on each decision: whether the candidate is hired, kept in reserve, not hired, withdrawn, or still pending. The table in chapter 4, stage 7 shows which go together.

Partners: sending people to us

A visit through the partner's link
Logged before the person has an account.

›

The person signs up
Credited to that partner, once, however long afterwards.

›

They buy a plan
Counted against the partner's numbers.

›

The partner's report
Visits, sign-ups and purchases, each as a share of the step before.

Partner credit, step by step. A link naming a partner we do not know credits nobody, because a wrong guess would pay the wrong party. A visit after signing up does not count, and a person is never moved from one partner to another.

1. **Reporters.** A partner names people who may read its report. Each reporter sees their own partner's numbers and nobody else's.
2. **Charts.** Numbers can be shown by day, week or month, over any date range.
3. **Estimated spend.** For a partner who charges per visit, the product estimates what the visits have cost against what those people paid, and emails our team as the estimate crosses each threshold, once per threshold. The partner's own invoice, based on its own records, is what is

paid.

4. **Referral codes.** Every user has one (chapter 3). It takes 10% off a plan, any number of times, for anyone but its owner. The owner is credited £2.50 for a one-month plan and £5 for anything longer, and our team records when that credit is paid out.

What can go wrong, and what you would see

- **A reporter opening another partner's numbers.** You read: *"You do not have reporting access for that partner."*
- **A partner we do not work with.** You read: *"No such partner."*
- **Removing reporting access that does not exist.** You read: *"No reporting access exists for that email."*
- **Asking for a partner's numbers on an exam it does not cover.** You read: *"That exam is not part of the pilot."*
- **A date range that ends before it starts.** You read: *"from_date must be on or before to_date."*
- **A chart grouped by something other than day, week or month.** You read: *"bucket must be one of day, week or month."*
- **Saving bank details for the first time without an account number.** You read: *"An account number is required the first time you save payout details."*
- **Marking a referral as paid when nobody used it.** You read: *"That referral has not been redeemed, so it has no payout."*
- **A new referral code that happens to match an existing one.** Codes are random, so this is rare and the product tries again: *"That referral code is already in use."*

CHAPTER 6

Our own team

Our staff have a console of their own. It creates and looks after organisations, handles money that needs a person, publishes study material, and keeps the background work running.

WHO
Staff given console access by another staff member

SEES
Every organisation, but changes only what the console offers

STATUS
WORKS TODAY

What the console can do

Create, rename, suspend and restore

What it cannot do

Create, rename, suspend and restore organisations. Seat an organisation's first person. Connect a school's own sign-in. Look up any account. Give and remove console access. Set up plans and prices, refund payments, record payments made by bank transfer, and write invoices. Retry emails that could not be delivered, and watch, cancel or retry background tasks. Moderate community posts. Write, voice and publish study material. Answer messages from the contact form.

Delete an organisation. Change a published station, scheme or study item in place. Remove a staff member's own console access, so the console always has someone in charge.

Money that needs a person

1. **Plans.** A plan has a short code that can never be reused, because past payments name their plan by it. Each plan has a twin at the referral price.
2. **Refunds.** A card refund goes through the card provider. Access is withdrawn only once the refund is made, so a failed refund changes nothing.
3. **Bank transfers.** A payment made outside the card page is recorded by hand, once, against its reference.
4. **Invoices.** For organisations. Once paid or cancelled, an invoice is final.

What can go wrong, and what you would see

- **A new plan with a code already used.** You read: *"A plan already has that code."*
- **Changing a plan that does not exist.** You read: *"No such plan."*
- **The card provider could not create the price.** No plan is saved: *"Stripe could not create that price. Try again in a moment."*
- **Refunding a payment already refunded, withdrawn or disputed.** You read: *"That payment has already been refunded, withdrawn or disputed, so it was not refunded again."*
- **Refunding a bank transfer through the card provider.** You read: *"That payment did not go through Stripe, so there is nothing to refund there."*
- **The card provider could not be reached for a refund.** You read: *"Stripe could not refund that payment. Nothing has changed; try again in a moment."*
- **The card provider refused the refund**, for example because the payment is too old. You read: *"Stripe refused that refund."*
- **Refunding a payment that does not exist.** You read: *"No such payment."*
- **Recording the same bank transfer twice.** It would grant access twice: *"That payment has already been applied."*
- **Changing a paid or cancelled invoice.** You read: *"That invoice is final and cannot be changed."*

- **An invoice line with no amount.** You read: *"Each line needs an amount, or a payment to bill for."*
- **An invoice that is not this organisation's.** You read: *"No such invoice."*
- **Replaying a message from the card provider that we never received.** You read: *"No such webhook delivery."*

Organisations, accounts and console access

What can go wrong, and what you would see

- **A new organisation with a web address already taken.** You read: *"That slug is already in use."*
- **Looking up an account that does not exist.** Only staff are ever told this; anyone else gets "no access": *"No such user."*
- **Giving console access to someone who has it.** You read: *"That person already has staff console access."*
- **Removing your own console access.** You read: *"You cannot remove your own console access. Ask another platform admin to do it."*
- **Sending a reset link to someone who signs in through their school.** No link is sent: *"No reset link was sent: this account signs in through its organisation."*
- **Clearing a person's progress on a station while one session is still running.** You read: *"One attempt at this station is still running; end it first."*
- **Trying out a marking scheme on a transcript with nothing the candidate said.** You read: *"Give one transcript to mark, with at least one line the candidate said."*

Background work, mail and messages

Marking, emails, reminders and the checks described elsewhere in this guide run as background tasks. An email is tried up to 12 times, waiting longer each time, over about five hours, and is then set aside for a person to retry.

What can go wrong, and what you would see

- **Retrying a task that cannot be retried here**, such as a failed marking. You read: *"That task cannot be retried here. A failed marking is retried from its attempt."*
- **Cancelling a task that is running normally.** You read: *"That task is running normally, so it cannot be cancelled. Reload the list."*
- **A task that no longer exists.** You read: *"That background task does not exist. Reload the list."*
- **Retrying an email that was sent, or is already queued again.** You read: *"That message is not waiting for a retry. Reload the list."*

- **Replying in the product to a contact message sent without signing in.** You read: *"That message was sent without signing in; reply by email."*
- **A contact message that does not exist.** You read: *"No such message."*

Study material

Slide decks, summaries, articles and podcasts are written as drafts, can be drafted by the AI, have their script checked, are voiced, and are then published. A published item is replaced, not edited.

What can go wrong, and what you would see

- **Editing a published item in place.** You read: *"A published item's content is replaced, not edited in place."*
- **Deleting a published item.** You read: *"Only drafts can be deleted."*
- **Publishing something already published.** You read: *"That is already published."*
- **Unpublishing something that is not published.** You read: *"That is not published."*
- **Saving a draft while it is being voiced.** You read: *"Production is in progress for this item; wait for it to finish or stop it."*
- **Two items with the same title.** You read: *"Something with that title already exists."*
- **A title with no letters or numbers.** You read: *"That title has nothing a URL can be made from."*
- **A kind of material we do not have.** You read: *"That is not a kind of study material."*
- **Filtering the list by something other than draft, published or all.** You read: *"Status must be draft, published, or all."*
- **Voicing a script that has not been checked**, or was edited since. You read: *"Write and check the script before voicing it."*
- **Starting production twice.** You read: *"Production is already in progress for this item."*
- **Stopping production that is not running.** You read: *"Nothing is running on this item."*
- **Narrating something that is not narrated**, such as an article. You read: *"That operation does not apply to this kind of study material."*
- **A fact-check note placed on a slide the deck does not have.** You read: *"A claim names a slide this item does not have."*
- **Asking the AI to draft a station that has no template.** You read: *"This station has no template, so it cannot be drafted."*
- **The AI wrote nothing usable.** No empty draft is saved: *"The model wrote no slides. Phrase the brief as the deck to write and try again."*
- **AI writing is not set up** on this copy of the product. You read: *"Content generation is not configured on this environment."*

- **Voicing is not set up** on this copy of the product. You read: *"Audio/video production is not configured on this environment."*

CHAPTER 7

How the sides connect

The three arms share one engine, one account per person, and one library. This chapter shows where they meet and where they deliberately do not.

THE SAME CONSULTATION, MARKED TWO WAYS

	PRACTISING ALONE	IN A SCHOOL OR EMPLOYER
AI marking	Yes, shown straight away	Yes, as a starting point for reviewers
Human review	No	Yes: one review per reviewer, combined as in chapter 4
Decision	No	In a real exam: drafted, signed off, then released
Who pays	The person, or a school giving practice access	The organisation, by contract
Is access checked	Yes, trial or plan	Never on exam day

1. **One person, one account.** A doctor who practises alone and is also a trainee at a school uses one sign-in and switches between the two.
2. **Practice access from a school.** A school can pay for its trainees to practise alone. That access ends on the date the school sets, or when the school is suspended.
3. **Shared library.** A school can bring one of our exams into its own programmes instead of writing
